

A Vulnerability Management Case Study

Leader in Transformational Cancer Treatment

The Challenge

The lab's directors had recently attended a cyber security conference where the lead speaker had stated that many organisations don't understand their total attack surface.

After learning the risks of hidden opportunities for attackers to breach their defences, the company decided they needed to investigate their total attack surface.

The Solution

Softwerx were able to set up F-Secure Radar, a best in class vulnerability management system.

Softwerx helped the company implement the solution, review the results of the initial scans and rectify the issues highlighted.

“We've established our total attack surface, now we can protect it.”

The Outcome

By running regular vulnerability scans on the company's entire online estate they can now be sure there are no chinks in their cyber armour.

Many cyber breaches are a result of attackers exploiting known weaknesses in software, the constant overview of the vulnerability management service means the company knows they are safe from known issues.
