

A Vulnerability Management Case Study

Charity Based Theatre

The Challenge

The theatre was concerned about data security and compliance, so they decided to complete CyberEssentials to help review, improve and document their security posture.

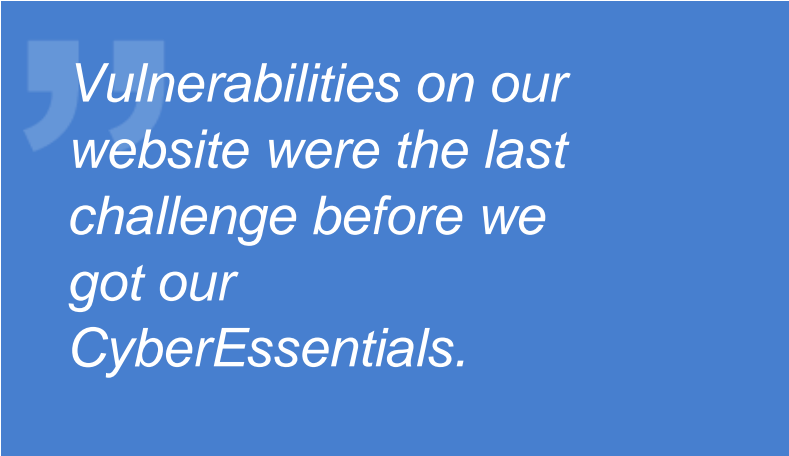

One of the most commonly accessed and public parts of any organisation's IT infrastructure is their website, making it the most vulnerable and the most likely to affect their customers, patrons and partners. A significant part of achieving CyberEssentials is securing your website.

The Solution

To secure their website the charity needed to know what the issues were.

After reviewing their requirements, Softwerx recommended F-Secure Radar, a complete vulnerability scanning and management system.

As a partner of F-Secure Softwerx were able to set up and manage the whole process.

A blue rectangular box containing a quote in white, italicized text. The quote is enclosed in large, faint quotation marks on the left side.

“Vulnerabilities on our website were the last challenge before we got our CyberEssentials.”

The Outcome

With the scanning system in place not only were the charity able to find the vulnerabilities in their website, but with the support of Softwerx they were able to secure them.

Now they have completed their CyberEssentials and can put the badge on their website, giving customers, staff and donors the reassurance of knowing they take their data security seriously.
