

A Breach Detection Case Study

Leading Groundworks Contractor

The Challenge

The company hadn't thought that businesses like theirs were worth targeting. However the construction industry is a more and more attractive target as more elements become digital. From project management to communication to drones or 3d printing, anything with an internet connection is a target.

Smaller businesses who may have out of date hardware and software are often particularly at risk. With the average cost per each record compromised in a data breach sitting at \$148 according to recent research they needed to know if about a breach before too much information could be compromised.

The Solution

The solution Softwerx recommended was F-Secure's rapid detection and response solution.

The solution provides constant monitoring and detection capabilities for quick identification and control of a cyber attack.

Thanks to Softwerx we have a solution that'll let us know if a breach happens before we lose too much.

The Outcome

The directors are now confident that they will know about a breach in time to notify and ICO and protect their business from major loss.

Softwerx are on hand to help if or when a breach does occur to get them up and running again fast, and make sure the gap is closed so no new attacks can use the same entry point.
