

# A Breach Detection Case Study

Midlands Based Specialist Business College

## The Challenge

The college discovered that an educational partner had been hacked. More than four months before they found out.

They'd been comfortable in their security posture, confident that their firewalls and protections were enough to safeguard their students and staff. Now they realised it wasn't enough. They need to know if someone has penetrated their defences.

However, there are thousands of options for breach detection software and implementation is key. They needed support.

## The Solution

The college approached Softwerx who recommended a managed implementation of F-Secure Rapid Detection & Response.

F-Secure offer best-in-class protection, cyber security strategies and incident response.

As an elite F-Secure partner, Softwerx offer implementation and managed rapid detection and response services.

*We went from knowing very little about breach detection to a solution in place within weeks.*

## The Outcome

The new system gives the college 24/7 cover and guarantees they will know about a breach inside 30-minutes. As a managed service, Softwerx are on hand any time to deal with issues that arise. The process is simple – detect the breach, quarantine the affected areas, assess the damage, repair the damage and re-enforce the breach point.
