

# A Breach Detection Case Study

Provider of the Next Generation Credit Card

## The Challenge

The business was a new entrant into the financial marketplace – one that demands a high level of security and compliance.

The FCA required a high level of capability and records for breach detection. They require notification, like the ICO, of any material breach, however unlike the ICO they require notification even if your customer's and prospect's data remains secure.

The business needed a quick to implement, scalable solution that let them know they were secure.

## The Solution

Softwerx helped the business understand the Breach Detection and Managed Detection and Response marketplace.

The review showed that the best tool for the job was F-Secure's RDS solution, providing 24/7/365 monitoring and a 30-minute response time.

Softwerx provided an initial implementation and ongoing monitoring support.

*“We already knew of F-Secure's heritage; Softwerx helped us deploy the RDS very quickly and efficiently.”*

## The Outcome

The solution has ticked a big regulatory box for the business and provided peace of mind today with clear scope to expand as the business grows.
