

A Business Continuity Case Study

Mid-Market Private Equity Firm

The Challenge

As a private equity firm the business's value is in its highly sensitive data.

The most common threats to data today stem from cyber attacks – and they are highly likely. Ransomware attacks are common place but could be easily negated if they could restore their data quickly.

The firm needed absolute security around both the recoverability and the safety of their data to ensure that they could continue trading, whatever happens.

The Solution

Softwerx recommended Databarracks.

In partnership, we delivered a sustainable framework for continuous continuity, ensuring plans remain relevant, effective and regularly tested.

The data is backed up and restored using enterprise grade software in a replicated data centre stored in a nuclear military bunker.

Knowing you have a backup is one thing; knowing that you can successfully restore data quickly is something entirely different.

The Outcome

The firm have already faced a crisis – and the solution has proved itself, keeping the business running despite an attack.

They are confident that they have an agreed level of business continuity in place.
